

Planning for system development in Newberg: An Overview

System Development Charges (SDCs) are one-time charges imposed on development. SDCs are designed to help cities equitably recover the cost of increasing infrastructure capacity to serve new development and provide for the expansion of existing systems required when new users increase the load on the existing infrastructure. ORS 223.297-314, also known as the "SDC Act" provides a "uniform framework for the imposition of system development charges by governmental units" and establishes "that the charges may be used only for capital improvements." ORS 223.297. Municipalities may establish SDC ordinances, but those ordinances must comply with the SDC Act. Oregon has been regulating SDCs since 1989.

At the start of 2022, the City Manager pledged that the City of Newberg would review its SDC rates and create its own SDC models rather than rely on contractors to build and update the SDC models. To further this goal, the City created an ad hoc committee, known as the SDC Task Force, to scope potential issues and provide recommendations for SDC reform. The SDC Task Force was created by Council motion on August 1st 2022. From the fall of 2022 through the summer of 2023, the SDC Task Force conducted five detailed and mathematically-intense review meetings culminating in a brainstorming session in July of 2023. The SDC Task Force's work was conducted within the framework of the SDC Act, which lays out the statutory requirements for SDC programs statewide.

Specifically, the SDC Act provides that:

- SDCs may be spent only in accordance with the requirements of the SDC Act.
- Improvement fees must be spent "on capacity-increasing capital improvements, including expenditures relating to repayment of future debt for the improvements."
- SDCs are one-time charges, not ongoing rates.
- SDCs charged by cities include water, wastewater, stormwater, and transportation.
- SDCs include both existing and future (planned) infrastructure costs.
- SDCs are for systemwide facilities, not "local" facilities.

Note that the SDCs for parks are set by and paid to Chehalem Park & Recreation District, not the City of Newberg.

General methodology for Newberg SDC rates

SDC calculations start with the City's Project List—these are capital projects that the City needs to build in its current planning horizon. These projects are identified by the City's capital improvement plan, public facilities plan, and master plan.

Each system is calculated in a different manner within the overall methodology. All of the City's SDC rates are based upon a development's fair share of the City's existing capacity (new load on the system) plus a development's fair share of future planned capacity (new as yet unbuilt infrastructure). In this context "fair share" means the additional load the new development adds to the current system as well as the calculated share of the cost of planned new infrastructure out to the build-out horizon of the city. Going one level deeper this can be expressed mathematically as:

The eligible value of unused capacity in existing facilities divided by the growth of system capacity required plus;

The eligible cost of planned capacity-increasing approved facilities divided by the growth of system capacity those facilities will create.

In other words, for each type of rate, the charge is equal to A + B where A is the existing systems growing load and B is the new or future system required to get to a projected place in the future where the system is "built out". In order to build the SDC model, the SDC Task Force used projections of the City's population and growth set to a thirty-year planning horizon, thereby imagining Newberg infrastructure as it will be in the early 2050s.

How each type of SDC charge is derived

There are different categories of development when it comes to SDCs. For example, a development of a single-family residence would face different charges from the development required to make a restaurant operational, which would be different from than a manufacturing facility, and so on.

As described already for all four components, the City calculates an amount based on the list of both projects that already increased capacity and projects that will need to be provided in the future.

The City then uses a formula to turn this amount into a dollar figure that can be used to calculate SDCs based on the following information about the development itself:

- The water charge is based on the meter size and whether the development needs a potable or a non-potable system. For instance, a manufacturing plant will likely need a larger water meter than a single-family residence.
- The wastewater charge is based on the number of fixture units planned for a unit. Fixtures like showers, toilets, a kitchen sink, laundry machines, a dishwasher, and so on are each assigned a number of "fixture units," which are added together to determine the amount of SDCs. For example, under the current model, 2 fixture units are assigned for each shower and 4 fixture units are assigned for each clothes washer. Most single-family homes have 18 fixture units. The base charge at the inception of the model is structured to be \$6,039.
- The stormwater charge is based on the amount of new "impervious surface" or hard surfaces created. An impervious surface is a structure like a road, sidewalks, driveways, distribution centers, etc., that are covered with material that resists the entrance or passage of water (e.g., asphalt, concrete, or rooftops).
- The transportation charge is calculated based on the "land use", "units", and trips during peak hours both in a vehicle and as a pedestrian. Land use references the type of development, from a hotel to a golf course to a library to a single-family home, and so on. Units are determined by the land use municipalities can calculate units based on square footage size, the amount of acreage, or on the number of rooms. The City of Newberg uses the Institute of Transportation Engineers Manual to determine trip rates for peak hours. For example, the SDC transportation charge for an 8,000-square-foot office building would be \$73,227 for the base year with this model. This is calculated from the base of 2.5 peak hour person trips times the gross square footage.

Greater granularity and more transparency

One major difference between the new 2024 SDC model and previous Newberg SDC models exists in the realm of detail and transparency. The new SDC model is the intellectual property of the City of Newberg and therefore belongs to all of our residents. Any resident or developer will be able to request a copy of the Excel workbooks that contain the infrastructure and project lists to see the algebra from which the rates are calculated. This represents the highest form of municipal transparency possible.

Secondly, whereas other cities' SDC rates move forward with the pace of inflation, the City of Newberg's model has legal rules that will allow it to be reviewed every two years to account for both inflation and depreciation. For example, as projects are completed, they will be moved from the projected side of the ledger to the existing system side of the ledger. This means that the exact value of the system both present and future will be assessed in a more granular and accurate manner.

SDC models are included

For complete transparency, the SDC models that underpin the new rates are included in this attachment on the following pages.

In some cases, example working was left visible in these graphical outputs to show how calculations might be rendered for example cases. This data is not applicable to any "real life" project. Please request an estimate from our engineering department to obtain true figures for a given project or development using the actual .xlsx model.

SDC Model Graphical Output

The next 53 pages are a graphical output demonstrating the XLSX workbooks for each of the SDC calculations.

They appear in alphabetical order:

- Stormwater
- Transportation
- Wastewater
- Water

If you would like a copy of the live .XLSX files please contact the City Mangers office (will.worthey@newbergoregon.gov)

Total SDC

6,039.00

\$

(1) From the Uniform Plumbing Code

Multiplier 1

Development of SDC Fee per EDU

Reimbursement Cost Basis (1)	\$3	33,389,305	Cost of infrastructure already constructed in the City - Existing Debt - Existing Reserves
Growth Capacity Requirements (EDU) (2)		28,201	Total number of Equivalent Dwelling Units projected at full buildout of the City.
Reimbursement \$/EDU	\$	1,183.98	Reimbursement Cost divided by the total number of EDU
Improvement Cost Basis (3)	\$ 1	11,423,469	Costs of Capital Improvement Costs needed to serve full buildout of the City
New Growth (EDU) (2)		2,353	Number of new EDUs expected based on the Planning Projections in the Master Plan
Improvement\$/EDU	\$	4,854.85	New project costs divided by the amount of new units.
TOTAL SDC/EDU		6,039.00	The reimbursement + the improvement is the total maximum allowable SDC
SDC/F		335.50	The total SDC is divided by 18 to get the cost per fixture unit.

1 - From the Inventory of Current System

2 - From the Planning Data

3 - From the CIP List

18 Fixture Units = EDU = Equivalent Dwelling Unit
